                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               80
Genes were identified by a combination of three methods: Gene prediction programs including GRAII (available by anonymous ftp from arthur.epm.ornl.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/-chris/EENSCANW.html), and NetplantGene (http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (http://www.tigr.org/tdb/at/at.html). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/). Simple repeats are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gtcgaagcaaactccgaaggagatgctctttacgctcttcgccggagtttaacagatccg 139

                                                                                                                                                                                                                                                                                                                                                                                                                    e-mail: xiin@tigr.org
BAC clone F9F8 is from Arabidopsis chromosome III and is near the
molecular marker g4547.
The orientation of the sequence is from SP6 to T7 end of the BAC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Direct Submission

On Feb 11, 2000 this sequence version replaced g1:6693723.
The sequence is of BAC F14D7 from Arabidopsis thaliana chromosome
1. The sequence does not represent the sequence of the entire
insert of this clone. It is shorter by 6954 bp because we submit
only the unique sequence of the clone. However, in order to
facilitate the joining of overlapping clones in the future for
creation of larger contigs, we provide small overlaps (200 bp)
between overlapping sumbitted clones. The 5' end of this sequence
overlaps by 200 bp to the 3' end of the sequence of the clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 (bases 1 to 81513)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           549
              prediction programs including GRAII (available by annotation), Genes including GRAII (available by annonymous ftp from arthur.epm.ornl.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/~chris/GENSCANW.html), and NetPlantGene (http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html), searches of the complete sequence against a peptide database nhtml), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (http://www.tigr.org/tdb/at/at.html).

Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity, to other proteins are named as funknown, proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are predicted by tRNAscan-SE (Sean Eddy, http://genome.wusti.edu/eddy/tRNAscan-SE/). Simple repeats are identified by repeatmasker (Arian Smit, http://genome.wusti.edu/eddy/tRNAscan-SE/).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              caatccc

P-PSDB; W47020.

Production of apomictic seeds - useful in plant breeding Claim 28; Pages 79-80; 123pp; English.

The sequence is that of an EST clone showing high homology SERK LRR (leucine-rich repeat) sequences.

Sequence 788 BP; 234 A; 191 C; 156 G; 207 T;

                                                                                                                 Production of apomictic seeds - useful in plant breeding Claim 27; Pages 91-95; 123pp; English.

The sequence is that encoding SERK, a putative receptor kinase. The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing that the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity plant proyeny. This is useful in plant can be developed into plant proyeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed propagated hybrids and could shorten and simplify the breeding programs allows plant breeders to develop cultivars with specific stable traits for such characteristics as height, seed and forage quality and maturity.

Production of apomictic seeds - useful in plant breeding
Production of apomictic seeds - useful in plant breeding
Production of apomictic seeds

CC In may be used as part of a method of producing apomictic seeds

CC comprising: (a) transforming plant material with a nucleotide

CC sequence encoding a protein which in active form in a cell or

CC ell membrane renders the cell embryogenic; (b) regenerating

CC the transformed material into plants or carpel-containing

CC plant parts; and (c) expressing the sequence in the vicinity

CC of the embryo sac. The apomictic seeds and embryos thus produced

CC can be developed into plant progeny. This is useful in plant

CC can be developed into plant progeny. This is useful in plant

CC can be developed into plant progeny. This is useful in plant

CC can be developed into plant progeny. This is useful in plant

CC can be developed into plant progeny. This is useful in plant

CC can be developed into plant provement and cultivar development in

CC capomictic plant. Apomixis provides for true-breeding, seed

CC apomictic plant. Apomixis provides for true-breeding, seed

CC propagated hybrids and could shorten and simplify the breeding

CC process so that selfing and progeny testing to produce and/or

CC stabilise a desirable gene combination could be eliminated.

CC apomixis allows plant breeders to develop cultivars with

CC specific stable traits for such characteristics as height,

DNA encoding plant morphogenesis regulatory protein - useful to yield plants with short stems or altered inflorescence Claim 1; Pages 6-10; 17pp; Japanese.

The present sequence encodes an Arabidopsis thaliana plant morphogenesis regulatory protein (MRP), which can be used to yield a plant with, e.g. short stems or altered inflorescence. The MRP acts on a plant at a specific site for a specific period, and can therefore be used to regulate extraneous gene expression in a plant. The MRP's cDNA or genomic DNA can be used to transform a plant to increase its MRP expression, and therefore control the form (particularly stem length) of the plant.

                                                                                                                                                                                                                                  New RRK polynucleotides and nucleic acid constructs - used for generating transgenic plants resistant to Xanthomonas Claim 1; Page 52-53; 67pp; English.

This invention describes a method for conferring disease resistance in plants. The invention describes the use of novel genes and proteins belonging to the Oryza longistaminata and Oryza sativa receptor kinase-like protein (RRK) Xa21 multigene family. Such genes from cassava, maize and tomato are also described. The genes and proteins cabe used for enhancing resistance to Xanthomonas in a plant, preferably

Claim 9; Page 85-87; 131py; Engilish.

T06307 is a tomato pathogen resistance gene Cf-2.2 partial cDNA clone. In a new method this gene is expressed highly in genetic constructs which may be used to impart a broad range of pathogen resistance, by induction of variegation, to transgenic plants (or parts or propagules of plants) containing such constructs. Cf-2.2 imparts resistance to the disease caused by the leaf mould fungal pathogen Cladosportum fulvum.

C.fulvum contains avirulence (Avr) genes that confer recognition by plants containing Cf-genes, leading to the activation of host defence mechanisms to attack the disease.

Claim 9; Page 80-83; 131pp; English.

706306 is the tomato pathogen resistance gene Cf-2.1. In a new method this gene is expressed highly in genetic constructs which may be used to impart a broad range of pathogen resistance, by induction of variegation, to transgenic plants (or parts or propagules of plants) containing such constructs. Cf-2.1 imparts resistance to the disease caused by the leaf mould fungal pathogen Cladosporium fulvum. C.fulvum contains avirulence (Avr) genes that confer recognition by plants containing Cf-genes, leading to the activation of host defence mechanisms to attack the disease.

Production of apomictic seeds - useful in plant breeding Claim 26; Pages 64-67; 123pp; English.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel containing plant material and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomixic provides and could shorten and simplify the breeding programation or containing the provides of the case that sexual plants are available as crosses with the case that sexual plants are available.

Apomixis allows plant breeders to develop cultivars with specific stable traits for such characteristics as height, seed and forage quality and maturity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Production of apomictic seeds - useful in plant breeding Claim 21; pages 40-46; 123pp; English.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant to breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed process so that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with seed in the could stable traits for such characteristics as height, seed and forage quality and maturity.

Tomato gene Cf-5, confers resistance to Cladosporium fulvum - useful for production of transgenic plants resistant to pathogens e.g. tomato leaf mould C. fulvum in tomatoes Claim 3; Fig 1a; 75pp; English.

This sequence is an example of the polynucleotide of the invention, a sequence is an example of the polynucleotide of the pathogen resistance on a plant. It is one of two two confer pathogen resistance against the pathogen cladosporium fulvum-5. Transgenic plants can be produced by incorporate the gene into plant cells; and regenerating plants from the cells; assexually or sexually produced offspring can also be subsequently

Tomato gene Cf-5, confers resistance to Cladosporium fulvum - usef for production of transgenic plants resistant to pathogens e.g. tomato leaf mould C. fulvum in tomatoes

Claim 6; Fig 1b; 75pp; English.

This sequence is an example of the polynucleotide of the invention is able to confer pathogen resistance on a plant. It is one of two CF-5 gene variants, which offer resistance against the pathogen Cladosporium fulvum-5. Transgenic plants can be produced by incorp the gene into plant cells and regenerating plants from the cells; assaually or sexually produced of the gene in plant cells can confer pathoge
                                                                                                                                                                                                                                                                                                                                                                                                  CF-5 pathogen resistance gene variant #2.

Expression of the gene in plant cells can confer pathogen resistance on a plant e.g. to tomato leaf mould (C. fulvum) in tomatoes. Oligonucleotides with sequences complementary to the gene or fragments of it, are useful in anti-sense techniques to reduce gene expression. The nucleic acids/polynucleotides are useful as hybridisation probes to identify other genes/fragments conferring pathogen resistance on plants e.g. Phytophthora resistance in potatoes. Homologies between Cf-5 and Cf-9 may be used to identify further resistance genes of this class. Sequence 3979 BP; 1217 A; 717 C; 698 G; 1347 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      resistance on a plant e.g. to tomato leaf mould (C. fulvum) in tomatoes. Oligonucleotides with sequences complementary to the gene or fragments of it, are useful in anti-sense techniques to reduce gene expression. The nucleic acids/folynucleotides are useful as hybridisation probes to identify other genes/fragments conferring pathogen resistance on plants e.g. Phytophthora resistance in postering bathogen resistance on plants e.g. Phytophthora resistance in postering sathogen set tween Cf-5 and Cf-9 may be used to identify further resistance genes of this class. 1
     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score

Patent No. 5952485

GENERAL INFORMATION:
APPLICANT: Ronald, Pamela C.
APPLICANT: Wang, Guo-Liang
APPLICANT: Song, Wen-Yuang
APPLICANTON: Disease Resistance in Plants
CORRESSEE: Townsend and Townsend and Crew Lip
STREET: Two Embarcadero Center, Eighth Floor
CITY: San Francisco
STATE: Galifornia
COUNTRY: San Francisco
STATE: Galifornia
COUNTRY: USA
ZIP: 9411-3834
COMPUTER: EDM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
